

to add a new Kafka docker we add a new server-2.properties file in the
“/home/bigdata/kafka_2.12-2.5.0/config” directory

scenarios it will require the same configuration properties like Socket Server Settings

we use all the properties of the already installed kafka docker but just change some parameters to distinguish the new Kafka docker

PS : we may use different configuration for other sections settings for example :

Group Coordinator Settings

Log Flush Policy

Change properties file with

broker.id=2

listeners=PLAINTEXT://0.0.0.0:9093

advertised.listeners=PLAINTEXT://master.local:9093

log.dirs=/tmp/kafka-logs-2

zookeeper.connect=localhost:2181

then save the new file with a distinguished name “ server-2.properties”

that Makes the local installation a second broker listening on port 9094

```
##### Server Basics #####  
  
# The id of the broker. This must be set to a unique integer for each broker.  
broker.id=1  
  
##### Socket Server Settings #####  
  
# The address the socket server listens on. It will get the value returned from  
# java.net.InetAddress.getCanonicalHostName() if not configured.  
#   FORMAT:  
#     listeners = listener_name://host_name:port  
#   EXAMPLE:  
#     listeners = PLAINTEXT://your.host.name:9093  
listeners=PLAINTEXT://:9093
```

```
##### Log Basics #####  
  
# A comma separated list of directories under which to store log files  
log.dirs=/tmp/kafka-logs-2
```
